

DEPARTMENT OF THE INTERIOR
UNITED STATES GEOLOGICAL SURVEY

EXPLANATION
SAMPLE SITES--Letters are explained on table 1.

Anomalous site--sample locality at which the colorimetric concentration for tungsten is considered to deviate from the upper limit of normal background values, as determined by inspection of histograms, percentiles, and enrichment relative to crustal abundance.

A Concentration for colorimetric tungsten

50-- Sample site at which tungsten was detected by spectrographic analysis.
Values given in parts per million.

NOTE

This map is one of a series of geochemical maps concerning the Petersburg area, southeast Alaska. For discussion of sample description, collection methods, media selection, sample preparation, statistical data, and analytical techniques, see Cathrall and others (1983)

Table 1.--Tungsten in 1361 minus-80-mesh stream sediment samples, Petersburg area, southeast Alaska.

[Concentrations in parts per million; < detected, but less than value shown; N, not detected at limit of detection or at value shown. Arithmetic mean, 2.4; standard deviation, 3.1; geometric mean, 1.8; and geometric deviation, 1.9, based on unqualified values within the sample population.]

Concentration	Map symbol	Frequency	Percentile
30-31	A	1	100
20-21	B	1	99.73
15-16	C	2	99.85
10-11	D	1	99.71
7-8	F	8	99.63
5-6	H	10	99.04
3-4	J	22	98.31
2-3	K	63	96.69
1-2	L	91	92.06
<1	M	383	85.38
N1	X	779	57.24
